

## Components:

linux linux kernel -

## Description:

A flaw was found in the ATA over Ethernet (AoE) driver in the Linux kernel. The `aoecmd\_cfg\_pkts()` function improperly updates the `refcnt` on `'struct net\_device'`, and a use-after-free can be triggered by racing between the `free` on the struct and the access through the `'skbtqx'` global queue. This could lead to a denial of service condition or potential code execution.
