

Problem:

You've found multiple **similar files**, no GUI involved, and now you want to **automate further actions** with a script.

Solution:

Use `ls -l > script.sh` command.

```
-l - list entries in folder  
> script.sh - bash script
```

Then prepend your tool or command to each line, and don't forget to add:

```
#!/bin/bash  
on top.
```
