CVE-2024-10979 - Score: 8.8

Components:

postgresql postgresql *

Description:

Incorrect control of environment variables in PostgreSQL PL/Perl allows an unprivileged database user to change sensitive process environment variables (e.g. PATH). That often suffices to enable arbitrary code execution, even if the attacker lacks a database server operating system user. Versions before PostgreSQL 17.1, 16.5, 15.9, 14.14, 13.17, and 12.21 are affected.

Main problems:

15 "External Control of System or Configuration Setting"
