CVE-2024-9193 - Score: 9.8

Components:

    whmpress whmcs 6.3
    whmpress whmcs *

Description:

The WHMpress - WHMCS WordPress Integration Plugin plugin for
    WordPress is vulnerable to Local File Inclusion in all versions
    up to, and including, 6.3-revision-0 via the whmpress_domain\
    _search_ajax_extended_results() function. This makes it
    possible for unauthenticated attackers to include and execute
    arbitrary files on the server, allowing the execution of any PHP
    code in those files. This can be used to bypass access controls
    , obtain sensitive data, or achieve code execution in cases
    where images and other   safe   file types can be uploaded and
    included. This makes it possible for unauthenticated attackers
    to update arbitrary options on the WordPress site. Utilizing the
    /admin/services.php file, this can be leveraged to update the
    default role for registration to administrator and enable user
    registration for attackers to gain administrative user access to
    a vulnerable site.
