Problem:

You want to avoid a fork bomb. This is the possibility of calling recursive processes in Bash on Linux. Shell kind for DoS – Denial of Service.

Use search maschine for more information.

Solution:

Configure `ulimit –u 400`

With this configuration is possible to set maximal number of processes (400 in this example) for one user.
Is possible to configure in:

```
~/.bashrc
/etc/profile
/etc/security/limits.conf
```
