Problem:

Want to see which processes are running on a Linux system and which ports they're using?

Solution:

Use `netstat -an` or `ss -tulpn`

```
Netid   ...              Local Address:Port    Peer Address:Port  Process
udp     ...                    0.0.0.0:5353         0.0.0.0:*      users:(("...",pid=571,fd=12))
udp     ...     [fe80::-1:-1:-1:1337]:546               *:*      users:(("...",pid=779,fd=25))
udp     ...                          *:5353                *:*      users:(("...",pid=571,fd=13))
tcp     ...                    0.0.0.0:22          0.0.0.0:*      users:(("...",pid=834,fd=3))
tcp     ...                       [::]:22             [::]:*      users:(("...",pid=834,fd=4))
tcp     ...                          *:5900                *:*      users:(("...",pid=819,fd=8))

...
```
